

Prototype feedback

As a team, we developed a prototype of our app's interface with its core functionalities. To create the prototype, we used Google Stitch and Material Design (from Android) as the design system. We received feedback from our professor and two different groups. Below is a summary of the feedback received.

- The app's name should be displayed on the home screen.
- The Wheels offers shown on the riders' offer screen should be prioritized according to the nearest available Wheels for the user.
- While a rider is waiting to be picked up, the cancel trip button (with a reasonable cause) should use a color that encourages user action.
- Remove the create button (the button with the plus symbol) from the payment reporting screen shown to drivers after a trip ends.
- Remove the option to leave comments about a user as part of the post-trip review.
- Given the app's target audience, it would be better to manage the rating system using visual tools such as icons or labels that indicate a user's behavioral profile.
- When a trip begins, it would be a good idea to offer a button that integrates Waze into the app by calculating the route, mainly considering the start point, the end point, and the meeting points.
- A user should be able to appeal a rating after a trip.
- The home screen that shows the available Wheels should separate, using different colors, the options for trips to the university and trips from the university to other destinations.
